# R-parity violating terms

A short reminder and introduction

RPV  
mSUGRA  
with  $\tilde{\tau}$  LSP

Sebastian  
Fleischmann

- ▶ Most general fully-renormalizable gauge invariant terms in the MSSM superpotential: Introduce baryon number ( $B$ ) or lepton number ( $L$ ) violating couplings

$$W_{Rp} = (\mathbf{Y}_E)_{ij} L_i H_1 \bar{E}_j + (\mathbf{Y}_D)_{ij} Q_i H_1 \bar{D}_j + (\mathbf{Y}_U)_{ij} Q_i H_2 \bar{U}_j + \mu H_1 H_2$$

$$W_{Rp} = \frac{1}{2} \underbrace{\lambda_{ijk} L_i L_j \bar{E}_k}_{\text{violates } L} + \underbrace{\lambda'_{ijk} L_i Q_j \bar{D}_k}_{\text{violates } L} + \frac{1}{2} \underbrace{\lambda''_{ijk} \bar{U}_i \bar{D}_j \bar{D}_k}_{\text{violates } B} - \underbrace{\kappa^i L_i H_2}_{\text{violates } L}$$

where  $i, j, k$  are generation indices

4

- ▶ Introduction of  $B$  and  $L$  violating couplings leads to rapid proton decay
- ▶ It is sufficient to suppress  $\Delta L \neq 0$  or  $\Delta B \neq 0$  terms to keep the proton stable
- ▶ Sparticles can be produced singly, possible on resonance
- ▶ Neutrino masses can be generated
- ▶ The lightest supersymmetric particle (LSP) is not stable anymore
  - ▶ The LSP is no dark matter (DM) candidate (but potential other DM candidates, e.g. Axino)
  - ▶ The LSP can be charged
- ▶ From existing precision measurements: Strong bounds on RPV couplings
  - ▶ Mass spectrum and production of SUSY particles not changed significantly by introduction of RPV couplings

# Benchmark points in $\mathbb{R}_p$ mSUGRA

- ▶  $\tilde{\tau}$ -LSP in broad range of mSUGRA parameter space
- ▶ Common feature, independent of RPV coupling:  $\tilde{\chi}_1^0 \rightarrow \tilde{\tau}\tau$
- ▶ Additional leptons may come from RPV stau decays
- ▶ Generic signature: Multi-lepton/tau final states + jets

## LSP in no-scale mSUGRA

Allanach, Dedes, Dreiner, Phys. Rev. D69 115002

Mass and nature of the LSP in no-scale mSUGRA:  $M_0 = A_0 = 0$ . Dashed lines show contours of lightest Higgs mass

# Benchmark points in $R_p$ mSUGRA

- ▶ Benchmark points with  $\tilde{\tau}^\pm$  LSP proposed by Allanach et al.
  - $A_0 = M_0 = 0 @ M_{GUT}$
  - $\text{sgn}(\mu) = +1$
  - $\tan\beta = 13,$
  - $M_{1/2} = 400\text{GeV}$
- ▶  $\tilde{\tau}$  is LSP,  $\tilde{\chi}_1^0$  is NNNLSP
- ▶  $\lambda$  or  $\lambda'$  coupling
- ▶ expected cross section @  $\sqrt{s} = 7\text{TeV}$ :
  - $\sigma = 0.28\text{pb}$

## LSP in no-scale mSUGRA

- ▶ Investigate feasibility of invariant mass estimation
- ▶ Use only “best combination” per event:
  - 1 Search for  $(p_T)$ -hardest tau (independent of tau charge).
  - 2 Search for nearest positive and nearest (here  $\Delta R$ ) negative lepton.
- ▶ Reject combination, if  $\Delta R(\tau, \ell^+)$  or  $\Delta R(\tau, \ell^-) > 1.5$
- ▶ For (unphysical) same sign combinations use the best matching and second best matching lepton of each charge.

No peak expected, but endpoint at simulated  $\tilde{\tau}_1$  mass (148 GeV), due to  $\nu_s$

$\eta$ - $p_T$  distribution of taus  
(MC visible momentum)

- ▶ very low  $p_T$  taus
- ▶ large overlaps between taus and other objects from SUSY decay chain
- ▶ Tau ID efficiency strongly reduced compared to "simple" event topologies

Tau ID efficiency (Delphes)

BC1:

$Z \rightarrow \tau\tau$ :

# RPV mSUGRA benchmark scenario BC 2

RPV  
mSUGRA  
with  $\tilde{\tau}$  LSP

Sebastian  
Fleischmann

- ▶  $\lambda'_{311}(M_{GUT}) = 3.5 \cdot 10^{-7}$  ( $L_3 Q_1 \bar{D}_1$  coupling)
- ▶ Leads to 2-body decay of the  $\tilde{\tau}$ -LSP:  $\tilde{\tau}_1 \rightarrow \bar{u}d$

- ▶ Less taus as in BC 1, no leptons from the RPV decay, but  $\tilde{\tau}$ -mass (in principle) fully reconstructable
  - ▶ Leptonic tau decays can be used for selection
  - ▶ Study done at  $\sqrt{s} = 10$  TeV, currently repeated at 7 TeV
- ▶ BC 1 and BC 2 are two extreme cases of the RPV couplings in terms of the phenomenology of the resulting final states

TO

universitat bonn

- ▶  $R$ -parity violation opens mSUGRA parameter space to other LSPs as  $\tilde{\chi}_1^0$
- ▶ Different  $\mathcal{R}_p$  couplings lead to various collider signatures
- ▶ BC 1 ( $\tilde{\tau}_1^\pm \rightarrow \tau^\pm \ell^\mp \ell'^\pm \nu$ ) and BC 2 ( $\tilde{\tau}_1^\pm \rightarrow qq$ ) scenarios are phenomenological “extreme cases” of RPV models with  $\tilde{\tau}$ -LSP
- ▶ BC 1 scenario easy to discover; clean signal sample
  - ▶ Parameter scan (in  $M_{1/2}$  and  $\tan\beta$ ) around the benchmark point shows sufficient cut efficiency
  - ▶ Reconstruction of  $\tilde{\tau}_1$  mass difficult in BC 1, but mass estimate possible with few years data
  - ▶ Tau ID experimentally challenging (low- $p_T$  taus and overlaps between tau jets and other particles)

reconstruction

Summary and  
Outlook

Backup

- ▶ Even at  $\sqrt{s} = 7 \text{ TeV}$  it is possible to select (nearly) background free samples at high signal efficiency
- ▶ QCD contribution assumed to be negligible
